Page 12-14: FAQ, Advice & Theoretics

You can find playlist files for the Complete beginner and intermediate beginner routines [here](#). I won't make playlist files for the later routines because I would rather you pick and choose with the alternative scenarios.

There is also now a [patch notes document](#) you can look at to see what changes have been made to the guide. (The version number of this document is in the bottom right hand corner of this page).

Guide structure

Categories

There are three major categories and one semi-major category of scenarios in Kovaaks, these are Tracking, Target Switching, Click Timing and Movement Aiming.

These will be colour coded as such; blue is Tracking, red is Click Timing and purple is Target Switching.

Movement Aiming scenarios still occupy one of these three major categories and will instead be marked by an underline.

For example; gp 1 Invincible is a Tracking scenario, Wide Wall 6 Targets is a Click Timing Scenario, kinTargetSwitch is a Target Switching scenario and Pasu Dodge Easy is a Click Timing Movement scenario.

Routine Categories

Much like scenarios there are also categories for the routines themselves, these can be seen as contemporaries to the scenario categories, and as such there are routines for Tracking, Click Timing and Balanced.

Do note that a Balanced routine is not explicitly a Target Switching routine even though they share the same colour. That being said someone following a Balanced routine will likely be better at Target Switching over other categories and will likely have more Target Switching scenarios in their routine.

Extras and alternatives

At the bottom of each routine are extra scenarios, these are scenarios you can add to the routine if you want to train for longer or want an extra challenge or to work on something you feel you are lacking in. If for example if you were doing a Click Timing routine but you feel you underperform in Tracking you might want to add extra Tracking scenarios to your routine. In the later stages of this guide the extra scenarios will focus more on skills not covered in the main routine.

The Alternatives are scenarios you can choose to do instead of the first scenario in their row. The routines are set up so that if you picked the first scenario in each row it would be an acceptable routine, but you should pick the scenarios that you feel apply the most to what you want to improve at. That might be scenarios similar to the games you play, or scenarios you aren't very good at, or whatever motivating factor you might have. This could just be the scenarios you find the most enjoyable. This structure will continue to be used further into the guide, although more alternatives will be offered. As you progress further into the guide feel free to experiment with how you structure your routine, whether that is doing multiple scenarios from one row, skipping a row entirely if you feel it isn't applicable to you, and especially changing which scenarios you do on some cycle, be that daily or weekly etc.

Duration / Time

It is assumed that you are playing in challenge mode and not free play, where you would do enough challenge runs to take the specified amount of time. Most scenarios have a challenge time of 1 minute so for example 10 minutes of play would be 10 challenge runs. To learn more read the "1-minute challenge exceptions" section on page 13.

In regard to Plaza style scenarios, just play however many runs is required to take the specified amount of time. If it takes you 3 minutes to finish a run of Ground Plaza Easy and you are asked to play for 10 minutes, just play 3 (or 4) runs.

Benchmarks

Below is a set of target high scores for a scenario in each category. Try each scenario as many times as you want and pick a level and routine based on your performance. Note that the score targets are for your high score, not average. This is just because tracking averages can be unreliable and tedious.

	Bounce 180 Sparky	Bounce 180 Tracking	Pasu Track Invincible v2
Complete Beginner	<50	<40	<3000
Intermediate Beginner	50 to 55	40 to 45	3000 to 3600
Advanced Beginner	55 to 65	45 to 56	3600 to 4500
Sub-Intermediate	65 to 75	56 to 68	4500 to 5500
Intermediate	75 to 85	68 to 80	5500 to 6200
Advanced	85 to 95	80 to 90	6200 to 6900
Sub-Aimbeast	95+	90+	6900+

What level to start at

Where you start is up to you but the routines are designed to be appropriate to your skill level. I would generally suggest meeting two of the score targets for a level to justify starting there. If you are lacking a fair bit in some categories compared to others, I would also consider starting on the balanced routines to help you catch up.

Should I do the Tracking, Click-Timing or Balanced Routines?

Which type of routine you do depends entirely on what you want to focus on. Whether that is a particular game you want to improve at, a type of weapon you want to improve at, or just whatever you feel you aren't good at.

Overwatch is a good example of these variables, even though its one game there are a lot of very different characters. Tracer and Soldier could be considered tracking-based characters, while Ashe, McCree and Widow could be considered click timing. Balanced routines are for if you play a mix of both.

As an example;

Tracking = sustained rate of fire = Soldier76/Spitfire/Lightning gun
 Click-Timing = Semi-auto = Shotguns/Snipers // '1-tap' AR's (AK/VANDAL)

balanced routines often put an emphasis on target switching since it incorporates elements of both tracking and clicking.

Generally tac shooters like CS/VAL are best practiced with Click-Timing routines. Most Battle royals and Team death match games would be a mix of either balanced or tracking. For most games, unless there is a very heavy focus on either low or high TTK (time to kill) it is hard to pin a specific routine type to that game. Just go with something similar to your playstyle. I should also mention since some people ask... It is only intended for you to do one of these routines, but you can do two a day if you want.

Legacy benchmarks

Meeting the score target for these qualifies as meeting the score target for that category of aim. At the moment this is **1wall6targets TE** and **Close Long Strafes Invincible**. **1wall6targets TE** was replaced since it is very common to just not be very good at static click timing scenarios like this, especially among people who don't play tactical shooters like CS:GO and Valorant. **Close Long Strafes Invincible** was replaced since it is favours high refresh rate too much.

Legacy benchmarks	1wall6targets TE	Close Long Strafes Invincible
Complete Beginner	<115	<10000
Intermediate Beginner	115 to 128	10000 to 12500
Advanced Beginner	128 to 140	12500 to 13800
Sub-Intermediate	140 to 160	13800 to 15200
Intermediate	160 to 175	15200 to 16400
Advanced	175 to 195	16400 to 17300
Sub-Aimbeast	195+	17300+

Complete Beginner Routines

Don't feel bad for starting here, you will breeze through the first few levels anyway. You also shouldn't worry about how well you perform at this stage, just focus on getting a feel for the scenarios and your mouse. Do this stage for **1 week**. You can also retry the benchmarks at any time if you feel like it, you do not have to beat them to move on though.

Tracking Routine	Time
Midrange Long Strafes Invincible	10 mins
Wide Wall 6Targets Jumbo	7 mins
air far long strafes	10 mins
Tile Frenzy 180 Strafing	4 mins

patTargetSwitch 90 easy	

Intermediate Beginner Routines

I would suggest looking at (if you haven't yet);

1-minute challenge exceptions on page 13

Do this stage for **1 to 2 weeks** or retry the benchmarks whenever you want. Like before doing the benchmarks isn't a requirement.

Tracking Routine	Time

Advanced Beginner Routines

If you haven't yet, I would suggest looking at;

1-minute challenge exceptions on page 13

Extras and alternatives on page 2

After **3 to 4 weeks** you can move on to sub-intermediate. Or give the benchmarks another shot whenever you think you are ready for the next level. As long as the next level doesn't feel too difficult you will be fine.

Intermediate Routines

If you haven't yet, I would suggest looking at;
Movement/Dodge Scenarios on page 14

Since you are going to be doing this level for longer than the previous levels, I'm going to give you score targets to meet. You Don't need to meet all of the score targets, but you should try for a good handful, around four to eight scores should be a good target.

Tracking Routine		Alternatives

FAQ, Advice & Theoretics

How do I get my Fortnite sense into Kovaaks? / Why does my Fortnite sense feel too fast?

Your Fortnite sense won't feel the same in Kovaaks due to most scenarios being in first person. Your sense feels faster the lower FOV you are on, and while setting your FOV to 80 Fortnite is technically the same angle of FOV, the different perspective still results in seeing less of your surroundings. So it is generally recommended that you just play on 103 overwatch FOV since it is a more appropriate FOV for first person play (third person games usually have much lower FOV to compensate for the perspective).

After that just set your sense scale to Fortnite percent and copy your sense from Fortnite. You can tweak it in kovaaks if it still doesn't feel right but don't stress too much about it. The way aim training works doesn't rely on your sense being exact or identical.

Why is Edpi bad? / what is cm/360?

While Edpi (effective DPI, Sense * DPI) might work when talking to someone about a specific game, it is not very useful when talking about sensitivity in general since it is not the same for all games. Instead of Edpi you should learn what your sensitivity is in terms of cm/360 (inch/360, deg/mm, cm/rev). cm/360 is a measurement of how many centimetres of horizontal mouse movement is required to rotate a full 360-degrees in game. You can find out what your sense is in terms of cm/360 by using any of a number of sensitivity calculators, the best one I have found is [this](#). Just choose your game, enter your in-game sense and the DPI of your mouse and it will tell you what that is in cm/360. Whatever website you used to find your cm/360 will (*almost*) always offer the ability to convert it to another game by telling you what sense you would use in that game.

Why are the ratings bad for some of these scenarios?

Kovaaks uses Steam's workshop ratings which are heavily biased towards scenarios with a high play count. Because of this, well established scenarios that have been around for ages have much higher ratings than they deserve. This also causes a lot of new players to come into Kovaaks and grind scenarios like Tile Frenzy and Ascended Tracking v3 regardless of flaws with those scenarios. Basically the rating system is more a measure of popularity rather than quality.

How much of my arm should be on my desk? / Should I hover my arm above the pad?

As a starting point you should put your arm on the desk, at least your wrist and half your forearm, and lift your elbow enough that you aren't putting unnecessary weight near your point of rotation as doing so will hinder your ability to turn smoothly. From there you can adjust as you see fit and figure out what works for you. Ideally only put enough of your arm's weight down that it doesn't stop you from sliding your arm across the pad. Your elbow and the forearm near your elbow can touch the pad, you just don't want it to be too much weight or it will make it harder to move around smoothly.

In general; More arm weight = more stability, too much arm weight = Too much resistance when turning.
Less arm weight = easier to move, Too little arm weight = shoulder fatigue and a lack of control / stability.

Feel free to play around with having your arm further forwards or back, how far from your side your elbow is, how much arm you use, etc... This is a pretty subjective part of aim training and what I have above is just a starting point to work from.

1-minute challenge exceptions

When following a guide it is generally expected that you would be playing the scenarios in challenge mode, which usually last one minute. Here is a list of ways and reasons a scenario might not just last one minute.

1. Time scale is a mechanic where the scenario runs slower (or faster) based on a multiplier set by the creator. So even if the challenge timer says 1 minute it will be longer anyway. The two main scenarios that use this are 1wall5targets_pasu and Bounce 180 which take 1:26 and 1:10 minutes respectively. Fortunately for you, the session timer was updated to not be affected by time scale in early 2020 so it will accurately reflect the amount of time you have spent playing the scenario, although it will not tick back time if you reset a challenge run part way through. You can also multiply the desired amount of time by the scenarios time scale, e.g. 8 mins * 0.7 = 5.6 or ~6 complete runs, (pasu is 0.7, bounce is 0.85).
2. The next reason a scenario might not take 1 minute is because of defined duration itself. Some scenarios were set to have a different amount of time by their creator, this one is pretty easy to figure out for yourself though, since the duration is right there in your face. Some examples are, tile frenzy at 30 seconds, pressure aiming at 2 minutes, ascended tracking at 1.5 minutes just to name a few.
3. The third reason why is because of what some would call a 'Plaza style' scenario. A Plaza style scenario is one where instead of playing the scenario for a specific amount of time, you are against a bot that changes each time you kill it, and the scenario ends once you have taken out all of the variants of the bot. The titular scenario here is called ground Plaza, other scenarios that fit this description include Air and thin gauntlet. It is important to note that these scenarios will trick you by saying you have a massive amount of time left in the challenge run, something like 16 minutes or even multiple hours, however these scenarios will usually only take somewhere from 2 to 5 minutes depending on which scenario specifically, and how good you are at them. Like I said, these end when you have taken out the last version of the bot, and they score you based on remaining time (most plaza style scenarios have 8 or 9 bots for you to take out).

Motivational fatigue

It is important that aim training doesn't feel like a chore otherwise you won't improve much during the time you spend aim training. It is very easy to become jaded and complacent due to the effort and repetitiveness of aim training; this is a common cause of plateaus in improvement. There are a few pieces of advice I can give you;

- 1) Re assess what aim training means to you and what your goals are. You very well might just not have the drive or find enough enjoyment in the improvement process for aim training to feel worthwhile.
- 2) Try changing the way you divvy up your routine over the course of a day. You might enjoy the process more if you practice for periods of 20 minutes or so multiple times over the course of the day until you finish however much you set for yourself to do in a day. You could bounce back and forth between the scenarios you set for yourself to do, like 5 minutes of one, 5 of another etc and repeat until you have done however much you set out to do for each scenario.
- 3) Try different scenarios, You may find that what you are currently training on is stale or you are so familiar with the process of those scenarios that it doesn't interest you. This is a large part of why alternating scenarios daily or however often you like can be a good idea, keeping your routine engaging is an effective way to maintain interest.
- 4) It is worth understanding that a big part of becoming really good at any skill is overcoming the weight of your own expectations. Any success will make you feel good, failing to see that success repeatedly fills you with doubt. This doubt can lead you to become demotivated due to the lack of consistent reinforcement. You CAN however become very good at anything you put your mind to, and that is the truth. Believing it and having faith in your ability to improve is the best motivator you could hope for.

Movement / Dodge Scenarios

Dodge scenarios can be identified by an Underline and will first show up in the Extra scenarios in Intermediate and then the main routine in Advanced. Dodge scenarios will contain one or both of these scoring mechanics; **Movement Score** and **Distance Travelled**. “Distance Travelled” is based entirely on how far you travelled during the challenge run, the more you move the more score you get, so focus most of your attention on shooting while subconsciously strafing within the space given to you. “Movement Score” on the other hand is a bit more involved, in a scenario that uses movement score you will have a bar that fills up while you are strafing, when you changed directions you get given score equal to the time spent filling the bar multiplied by a specified value. Note that the strafing durations and multipliers are decided by the scenario’s creator. If the bar fills completely changing direction only gives you score based on the maximum time required to fill the bar so change directions before it fills up. Changing too early will *usually* result in you getting a lower multiplier. As long as you change directions while the bar is in the “good” section (green by default but you can change the colour in the UI settings) you will get the maximum score, so don’t stress about when exactly you change direction as long as it’s not immediately (i.e. don’t ADAD spam) and not while the bar is full. A good piece of advice I can give you is to go to the sound settings and add a sound to the “MBS – Good” field near the bottom, I personally like bodyShot02 and headshot02 for this. That way you get audible feedback for when you changed directions at the right time, this helps with avoiding the need to pay visual attention to the bar (you can even just turn the bar off in the UI settings).

Aimer7 also made [this](#) strafe aiming guide that has a truly impressive amount of technical information in it that you should definitely consider reading. It also has some routines for learning how to strafe aim which are also worth trying.

Tracking your progress while aim training

Keeping track of your performance and improvement while aim training can be a great way to motivate yourself to keep going. Using a word/excel document to keep logs of your daily scores and your high scores is very common. Here are some resources you can use for tracking your progress.

[This excel spreadsheet](#) that I made can be downloaded and used to track your progress. This document is macro-enabled so you will need to accept the macro when you open the spreadsheet. The macro is just for adjusting the ranges on the graphs automatically.

[This Google sheet](#) is the same and does not require excel ,however it does not adjust the ranges on the graphs automatically. In order to edit the document just make a copy of it.

You can also use [fat dash](#) to make graphs of your progress. [Here is a video](#) of how to use fat dash, and [here is a pdf](#) of how to use it.
